

Azure Fundamentals Summary Report

Selected Region:

I selected South Africa North (Johannesburg) as the Azure deployment region because it is geographically closest to Lagos, Nigeria. Choosing a nearby region helps reduce latency, improve performance, and provide better response times for cloud resources.

Shared Responsibility Model:

For the Azure Storage Account deployment, Microsoft is responsible for managing and securing the physical cloud infrastructure, including datacenters, networking, hardware, and platform availability.

As the customer, I am responsible for managing access permissions, protecting account credentials, monitoring resource usage, and securing the data stored in the resource.
